

Example: Candidate (Class 1)

Example: False Positive (Class 0)

- **Red arrows (left side)** → features pushing the prediction **upward** (towards a higher probability of being classified as a certain class).
- **Blue arrows (right side)** → features pushing the prediction **downward**.
- The **base value** (vertical line near 0) is the model's expected prediction before seeing the features.
- The final value **f(x)** is the model's output for that sample.
- The **second image** shows some features (like koi_fpflag_co and koi_fpflag_nt) strongly pushing the prediction **down** (toward negative / false signal), while others (koi_prad , koi_steff , etc.) push it slightly upward.
- The **first image** shows most features pushing strongly upward, leading to a higher predicted value.

These are SHAP force plots used to interpret individual predictions of ML model.
